DETAILED ACTION

Response to Election

Applicant provisionally elected the species II without traverse. Applicant also designated that the claims 1-6 and 8 read on species II. Examiner agrees with this statement. Therefore, it is concluded that the claims 7 and 9-35 are considered non-elected claims.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yang (Fig. 3).

Yang (Fig. 3) discloses an amplifier circuit comprising a transconductance stage (Q1) which is operable to receive an input voltage signal (VIN) and to produce an output current signal (X) and the transconductance stage (Q1) including a first Metal Oxide Silicon (MOS) transistor having a first gate oxide thickness (gate oxide thickness of Q1) and a first channel length (channel length of Q1), and a cascode stage (Q2) which is communicatively coupled to the transconductance stage (Q1) that is operable to receive the output current signal (X) and to produce an output voltage signal (VOUT) based thereupon, the cascode stage (Q2) including a second MOS (Q2) transistor having a second gate oxide thickness (gate oxide thickness of Q2) and a second channel length (channel length of Q2). As described above, Yang (Fig. 3) discloses all the limitations in the claims except for that the second gate oxide thickness is substantially thicker than the first gate oxide thickness, second gate oxide thickness is approximately twice as thick as the first gate oxide thickness, the second gate oxide thickness is approximately 100 Angstroms, the first gate oxide thickness is approximately 50 Angstroms, the second channel length is substantially longer than the first channel length, the second channel length is approximately twice as long as the first channel length, the second channel length is approximately 0.35 microns, and the first channel length is approximately 0.18 microns. It would have been obvious to one of ordinary skill in the art at the time the invention was made to have implemented the specific values of the

Art Unit: 2817

gate oxide thickness and channel length of the transistors, since they are based on the routine experimentation to obtain the optimum operating parameters.

Allowable Subject Matter

Claim 8 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Patent numbers (6,924,703; EP-0-003-808) are the cascode amplifiers.
